

Learning, with continuity.

My role: [role], working with [team] to design [owned scope].

Shipped in 3 months.

Showcased at the India AI Impact Summit 2026.

Desktop + mobile

Three months to build. A summit stage to show it.

Showcased at the Google and ARTPARK booths, India AI Impact Summit 2026.

3 months

From build to shipped product

2026

India AI Impact Summit, New Delhi

ZenteiQ

Client and product organization

What we built

AhamX is an AI-assisted learning and skilling platform for learners, educators and organizations, bringing learning, community and course creation into one experience. Built for ZenteiQ, it connects personal progress with the people and organizations supporting that learning.

Outcome: shipped in three months and showcased at the India AI Impact Summit 2026.

Too much to remember.

People need to pursue their goal while keeping track of their role, progress and unfinished work.

The learner

After an interruption, finding the right lesson can cost the small window they had to study.

The educator

AI can create a draft quickly, but the educator still carries responsibility for accuracy and teaching quality.

The administrator

A relationship or profile change can affect an organization. Ambiguous identity makes action feel risky.

Design question

How can every screen help a person understand where they are, what is ready and what to do next?

Understand the pressure behind the click.

Working assumptions, to validate with users.

Situation	Hidden concern	Experience response
A learner returns after a busy week.	I have forgotten where I stopped.	Show the current course and completion state.
An educator reviews AI output.	My name will be attached to this.	Keep editing and review stages explicit.
An administrator changes a relationship.	Am I acting for the right organization?	Show identity, relationship type and status.
A learner studies on a phone between commitments.	I only have a few minutes.	Keep the learning context readable and reachable.

Ananya. Educator, creator and cohort mentor.

Working persona, built from the product's role model.

Ananya

Accountable for the learning experience, even when AI helps produce it.

What success feels like

A course she understands, can improve and feels confident sharing with her students.

What creates hesitation

Unclear readiness, repeated setup and uncertainty about which identity is active.

What she needs from the product

A visible next step, recoverable work and control over each stage before publishing.

Three decisions that shaped the build.

Trade-offs visible in the delivered flows; the rationale below is inferred from the screens.

01

Separate the AI stages

Prioritize review of content, script, audio and video. The cost is more steps; the benefit is a clear checkpoint at each transformation.

02

Keep initial setup short

Ask for essential organization details first and allow later updates. This makes setup lighter while deferring some profile completeness.

03

Make relationships explicit

Show incoming requests and Approve / Reject actions. This adds a decision step while clarifying what is being requested.

Discovery plan: what I'd ask next.

Questions to test the working assumptions behind the three design stories.

Learners

Tell me about the last time you tried to resume a lesson. What made you stop or search?

Educators

Show me the last piece of generated content you changed. What made you doubt it?

Organization leads

Walk me through the last request you approved. What did you need to verify?

Validation loop

Example > friction > decision > changed screen > validation

Progress gives people a place to return.

Bodhi is the learner home. Sarathi is the community feed. Together, they connect study progress with people.

The user tension

An interrupted learner needs to recover context before choosing what to do next.

The design response

Keep learning progress visible beside recommendations, with completion percentages and lesson counts.

The trade-off to test

Scores and recommendations also compete for attention. Test whether learners can locate their next lesson.

Learner dashboard: progress and lesson counts are visible, helping a returning learner identify where they stopped.

An AI draft still needs an educator's judgment.

Every AI step is visible before the next: lesson content, script, audio and video.

The user tension

The educator is accountable for what students learn, including material drafted with AI.

The design response

Expose the outline, count ready lessons and separate the production stages so each can be reviewed.

The trade-off to test

Review adds effort. Test whether educators know what remains and can move through the stages confidently.

Outline: 0/8 lessons ready is shown beside an inactive Publish control, making incomplete readiness visible.

People should see what a request will change.

Short setup. Teaching context preserved. The relationship model stays visible as the organization grows.

The user tension

An administrator must understand the requested relationship before acting for an organization.

The design response

Put the requester, relationship type, date and Approve / Reject actions together in the request row.

The trade-off to test

A row can explain intent without explaining every consequence. Test comprehension before approval.

Network: each incoming request shows who, what relationship and when, with Approve and Reject.

How I'd measure confidence.

Measure task success and understanding together, before setting improvement targets.

Question	Measure	Baseline
Can learners resume without help?	Completion rate + time to resume	To be established
Do educators understand readiness?	Correct next-step identification	To be established
Is the active identity clear?	Role comprehension + wrong-role actions	To be established
Can administrators act confidently?	Request success + error rate	To be established

A roadmap beyond launch.

Directions to explore as the product grows.

Strengthen the core

Validate critical tasks, improve accessibility and establish reliable product metrics.

Deepen the guidance

Explore contextual tutoring and clearer controls for reviewing AI-generated lessons.

Connect the evidence

Explore how skills, learning progress and organization context can support a durable digital profile.

What I learned

In a three-month build, making the next step obvious mattered more than adding features.

Credits and sources.

Product	AhamX / ZenteiQ. AI-assisted learning, community and course creation.
Portfolio	Yogesh Battula. Exact role, collaborators and owned scope to be confirmed.
Delivery outcome	Shipped in three months and showcased at the Google and ARTPARK booths, India AI Impact Summit 2026.
Case-study framing	Working persona and empathy assumptions support the next discovery round. Design rationale is grounded in the visible flows.

[PM India: summit context](#)

Screen content is prototype data.

Progress gives people a place to return.

Learning and organization activity use different summaries for different responsibilities.

Learner dashboard: completion percentages and lesson counts help people recover their learning context.

Organization dashboard: aggregate counts and recent cohort updates provide an overview before detail.

Community is anchored in identity.

People can understand who is speaking and inspect the profile behind a contribution.

Sarathi: posts pair the author's name with role and department, giving the update context.

Personal profile: background and activity share one view, making the person behind a post easier to understand.

An AI draft still needs an educator's judgment.

Visible readiness and editable content support review before publication.

Outline: 0/8 lessons ready appears beside an inactive Publish control, showing that the course is incomplete.

Lesson editor: content can be reviewed and edited before moving to the narration script.

Every AI step is visible before the next.

Separate stages keep the transformation from teaching material to media visible.

Script: narration has its own review stage, so words can be checked before delivery.

Audio: playback provides a review point before proceeding to video.

Create once. Reuse often.

Preview media and keep learning material discoverable in the library.

Video lesson: preview, Save as Draft and Save actions make the final stage explicit.

Library: draft and completed learning material is visible in one collection, supporting later reuse.

People should see what a request will change.

A structural view and an action view address different parts of the same relationship.

Hierarchy: the current entity and relationship legend make its place in the organization visible.

Network: each incoming request shows who, what relationship and when, with Approve and Reject.

Short setup. Teaching context preserved.

Collect the essentials first, then manage learning through student groups.

Registration: name, type and email are visible, with a reminder that details can be updated later.

Cohorts: group cards show student and course counts, with a Manage action for each group.

The learning context travels with the person.

Learning, organization identity and cohort conversation remain accessible on mobile.

Bodhi: cohorts and learning time share one screen, providing a compact learning overview.

Entity profile: organization details and tabs preserve context on a smaller screen.

Cohort discussion: the channel and messages stay together, keeping the conversation in context.
